

PROTOTYPE REVIEW

Artbook Mobile App

Functional Android prototype review for backend/mobile handoff. This document describes what the current APK demonstrates, what is fake-local, and what a production team should connect next.

GPS scene matching

Themed pickers

Provenance Seals

Marketplace safety

Studio dashboard

Chat/collab rooms

Current App Shape

Home

Strokes, comments, forwarding rules, quick actions and live/social discovery.

Profile

Role-aware artist, streamer, business and institution profiles with media, services, trust and privacy.

More Hub

Navigation, account switching, theme selection, trust desk, delivery, location and backend handoff.

Market

Products, services, tickets, classes, digital assets, reviews, route checks and checkout holds.

Recent Improvement Pass

Discovery and locality

Country, city and locality now use Artbook-styled picker buttons instead of plain dropdowns. Discover and Tour can use manual scenes or GPS scene matching.

GPS behavior

The native wrapper requests Android location permission, then the app maps the phone fix to the nearest supported Artbook scene. Exact GPS should remain private unless the user chooses otherwise.

Main result: searching, filtering and location selection now stay visually aligned with themes and are more touch-friendly.

Location settings

Users can switch between phone GPS and profile/manual area. Discover and Tour areas can differ, which supports local discovery and exploring another city.

Backend requirement

Production needs server geocoding, privacy precision, spoofing controls and distance-aware ranking. Location must also affect delivery and pickup availability.

Function Review

AREA	PROTOTYPE BEHAVIOR	PRODUCTION CONNECTION
Discovery/Tour	Themed pickers, GPS/manual scenes, local artists/businesses/streamers.	Search index, geocoder, privacy rules, ranking, local content feeds.
Trust	Provenance Seals, reports, seller score and checkout holds.	Relationship-backed vouching, admin queue, disputes, payout holds.
Market	Search, type/sort pickers, reviews, services, products, tickets, digital assets.	Listings, inventory, order ledger, delivery provider, tax/settlement.
Messages	Text, voice/image/video/GIF placeholders, emoji, calls and collab shortcuts.	Realtime messaging, object storage, media scanning, call provider.
Finance	PIN-locked fake balance, send/request/top-up/checkout flows.	Immutable ledger, KYC, payment rails, Google Play Billing where required.
Collabs	Accepted rooms with split, phase, rights, tasks and publish tools.	Permissions, rights ledger, notifications, shared workspace records.
Profiles	Artist albums, business media, streamer vaults, privacy and status.	Profile media storage, verification, role policies, analytics aggregation.

What I Would Improve Next

Release wrapper

Move from prototype WebView packaging to a proper Android project with release signing, Play Console metadata and permission rationale screens.

Backend truth

Keep all sensitive state server-owned: balances, identity, orders, delivery, Seals, reports and media rights.

Admin console

Moderation, seller verification, event legitimacy, report triage and payout holds need an operations dashboard.

Design QA

Continue testing each theme on small Android screens and add accessibility contrast checks before public launch.

Prototype truth: the APK is functional for review and product conversation, but payments, KYC, calls, delivery and uploads are still simulated until the backend and providers are connected.
